

For now the variables our group determines to use are the edit times and vandalism protects times across certain time span, which is determined by the time span of data we get, and the computing power we can use to process the data in reasonable time and reasonable size

This first over view is a bubble chart, with bubble representing a category of Wikipedia articles, and the size of the bubble the number of articles under vandalism protection in a certain time. Also there is an axis under the graph, used to change the time of data.

User can click on single bubble, and go into this zoomed-in view of single category, and the new bubbles represents very single articles in this category, with the same axis as time line, used to change time.

User can click on single bubble, and go into detailed view of single article, surrounded with related articles in same category or other category, with the same axis as time line, used to change time.
